

Checkpoint #1 Raspberry Pi and ROS

[ICN5406] Mobile Robot 2020

Due: October 16, 2020

● Purpose :

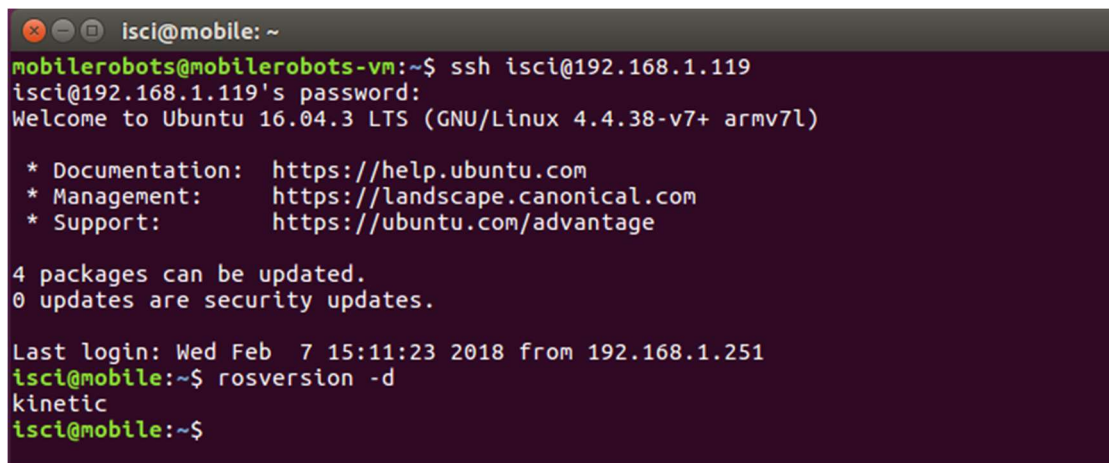

The purpose of checkpoint 1 is to make sure you set the development environment for robot right.

First, you will need to produce the image for your raspberry pi and install ROS in it. Then use `rosserial` package from http://wiki.ros.org/rosserial_arduino to communicate between Raspberry pi and Arduino.

● Tasks :

Demonstrate your environment setup by performing the following two tasks:

1. Use `ssh` command to remote connect to Raspberry Pi from your PC and use `rosversion` command show that you already install ROS Kinetic on Raspberry Pi. Such as Fig.1 show below. (30%)

```
iscil@mobile: ~  
mobilerobots@mobilerobots-vm:~$ ssh isci@192.168.1.119  
isci@192.168.1.119's password:  
Welcome to Ubuntu 16.04.3 LTS (GNU/Linux 4.4.38-v7+ armv7l)  
  
* Documentation:  https://help.ubuntu.com  
* Management:    https://landscape.canonical.com  
* Support:        https://ubuntu.com/advantage  
  
4 packages can be updated.  
0 updates are security updates.  
  
Last login: Wed Feb  7 15:11:23 2018 from 192.168.1.251  
isci@mobile:~$ rosversion -d  
kinetic  
isci@mobile:~$
```

Fig.1 SSH remote connection and ROS version

2. Use command and library from `rosserial` package to create a program which contains publishers and subscribers. It means that your Raspberry Pi should send and receive messages to and from Arduino. In this program, Arduino should receive a number from Raspberry Pi, multiply it by 2, and then send it back to Raspberry Pi. You should show the result from Terminal. An example result show below like Fig.2. (70%)

```

/home/iscsi/catkin_ws/src/communication/launch/checkpoint_1.launch http://192.168.1.1
iscsi@mobile:~/catkin_ws/src/arduino_smallcar/src$ roslaunch communication checkp
oint_1.launch
... logging to /home/iscsi/.ros/log/6045c50e-0fb0-11e8-9c99-b827ebaa4d9b/roslaunc
h-mobile-6808.log
Checking log directory for disk usage. This may take awhile.
Press Ctrl-C to interrupt
Done checking log file disk usage. Usage is <1GB.

started roslaunch server http://192.168.1.119:39678/

SUMMARY

Fig.2 Communication between RPi and Arduino

- Materials list:

	Material	Number
1	Raspberry Pi 4 Model B	1
2	16G micro SD card (with SD adapter)	1
3	USB Type A male – Type -C male	1
4	Arduino UNO	1
5	USB Type A male – Type B male	1
Raspberry Pi 3 Model B		SD card and adapter
		
Arduino UNO		USB A-C
		
USB A-B		

● Tutorial

In this tutorial we will go through about the environment setting on Raspberry Pi, the architecture of ROS and how to connect Raspberry Pi and Arduino by using *rosserial* package.

A. Environment setting on Raspberry Pi

1. Install Ubuntu mate 18.04
2. Install ROS Melodic
3. Setting SSH between Raspberry Pi and PC

B. ROS

1. ROS file system level structure
2. ROS computation graph level
3. Create package file
4. ROS nodes communication
5. Publisher and Subscriber
6. CMakeLists.txt
7. roslaunch

C. *rosserial* package

1. Arduino IDE setup
2. Create *swap* Space
3. Install the Software
4. Create a publisher by using *rosserial*
5. Create a subscriber by using *rosserial*

A. Environment Setting on Raspberry Pi

1. Install Ubuntu mate 18.04

(1-1) Download Ubuntu mate 18.04 form <https://ubuntu-mate.org/download/>

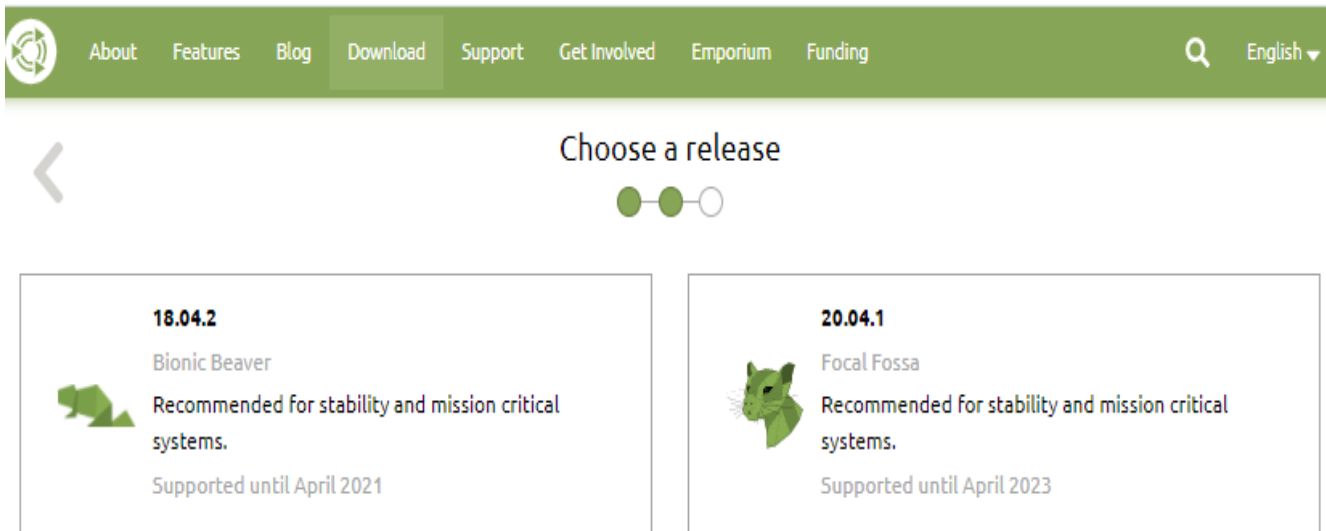

Fig.3 Ubuntu MATE 18.04 image file

(1-2) Then install Ubuntu mate image file in SD card. You can use any tool like **GNOME Disk** (like Fig.4 showed below) or other applications such as **ddrescue** on Linux or **Win32 Disk Imager** on Windows can be used.

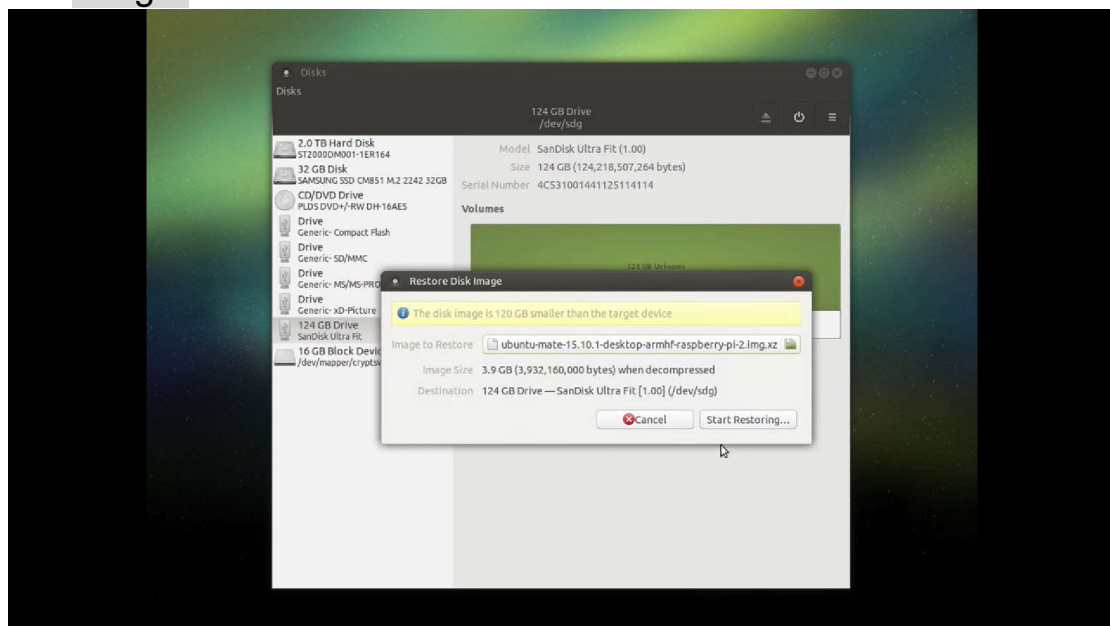

Fig.4 GNOME Disk restore image

(1-3) Then plug SD card in raspberry pi and connect to screen and finish all the initial setting.

2. Install ROS Melodic

(2-1) You can start to install ROS from

<http://wiki.ros.org/melodic/Installation/Ubuntu> “1.2 Setup your sources.list” and keep following the instruction until “1.7 Getting rosinstall”.

(2-2) In “1.4 Installation” we recommend you install **ROS-Base** in Raspberry Pi and **Desktop Install** in PC. Show in Fig.5 below.

This instruction takes about 2 hours to install ROS. Elapsed time may vary depending on network environment. Please start your environment setting earlier.

1.4 Installation

First, make sure your Debian package index is up-to-date:

```
sudo apt update
```

There are many different libraries and tools in ROS. We provided four default configurations to get you started. You can also install ROS packages individually.

In case of problems with the next step, you can use following repositories instead of the ones mentioned above [ros-shadow-fixed](#)

Desktop-Full Install: (Recommended) : ROS, [rqt](#), [rviz](#), robot-generic libraries, 2D/3D simulators and 2D/3D perception

```
sudo apt install ros-melodic-desktop-full
```

[or click here](#)

Desktop Install: ROS, [rqt](#), [rviz](#), and robot-generic libraries

```
sudo apt install ros-melodic-desktop
```

[or click here](#)

ROS-Base: (Bare Bones) ROS package, build, and communication libraries. No GUI tools.

```
sudo apt install ros-melodic-ros-base
```

[or click here](#)

Individual Package: You can also install a specific ROS package (replace underscores with dashes of the package name):

```
sudo apt install ros-melodic-PACKAGE
```

e.g.

```
sudo apt install ros-melodic-slam-gmapping
```

To find available packages, use:

```
apt search ros-melodic
```

PC

RPI

Fig.5 ROS installation for different processor

(2-3) Then follow the “3. Create a ROS Workspace” from <http://wiki.ros.org/ROS/Tutorials/InstallingandConfiguringROSEnvironment> to finish all the ROS setting.

3. Setting `ssh` between Raspberry Pi and PC

(3-1) Follow the instruction down below to install `ssh` in both your PC and Raspberry Pi.

```
$ sudo apt-get update
$ sudo apt-get install openssh-server openssh-client
$ sudo service ssh start
$ systemctl enable ssh.socket
```

(3-2) Find Raspberry Pi's address, netmask and gateway by using

```
$ ifconfig
$ route -n
```

```
iscimobile:~$ ifconfig
enx827ebff18ce Link encap:Ethernet HWaddr b8:27:eb:ff:18:ce
    UP BROADCAST MULTICAST  MTU:1500  Metric:1
    RX packets:0 errors:0 dropped:0 overruns:0 frame:0
    TX packets:0 errors:0 dropped:0 overruns:0 carrier:0
    collisions:0 txqueuelen:1000
    RX bytes:0 (0.0 B)  TX bytes:0 (0.0 B)

lo        Link encap:Local Loopback
    inet addr:127.0.0.1  Mask:255.0.0.0
    inet6 addr: ::1/128 Scope:Host
    UP LOOPBACK RUNNING  MTU:65536  Metric:1
    RX packets:166 errors:0 dropped:0 overruns:0 frame:0
    TX packets:166 errors:0 dropped:0 overruns:0 carrier:0
    collisions:0 txqueuelen:1
    RX bytes:12178 (12.1 KB)  TX bytes:12178 (12.1 KB)

wlan0     Link encap:Ethernet HWaddr b8:27:eb:aa:4d:9b
    inet addr:192.168.1.119 Bcast:192.168.1.255 Mask:255.255.255.0
    inet6 addr: fe80::ba27:ebff:feaa:4d9b/64 Scope:Link
    UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
    RX packets:971 errors:0 dropped:443 overruns:0 frame:0
    TX packets:542 errors:0 dropped:0 overruns:0 carrier:0
    collisions:0 txqueuelen:1000
    RX bytes:204183 (204.1 KB)  TX bytes:80972 (80.9 KB)

iscimobile:~$
```

Fig.6 Raspberry Pi's network information by using `ifconfig`

```
iscimobile:~$ route -n
Kernel IP routing table
Destination Gateway Genmask Flags Metric Ref Use Iface
0.0.0.0 192.168.1.1 0.0.0.0 UG 0 0 0 wlan0
169.254.0.0 0.0.0.0 255.255.0.0 U 1000 0 0 wlan0
192.168.1.0 0.0.0.0 255.255.255.0 U 0 0 0 wlan0
```

Fig.7 Raspberry Pi's network information by using `route -n`

(3-3) Setting static IP by edit `/etc/network/interfaces` file.

```
1 auto wlan0
2 iface wlan0 inet static
3 address <rpi's inet addr>
4 netmask <rpi's Mask>
5 gateway <rpi's Gateway>
6 wpa-ssid <your router>
7 wpa-psk <your_wpa_key>
```

```
8 dns-nameservers 8.8.8.8 <gateway>
```

(3-4) Using `ssh` to remote connect with PC.

```
$ ssh <user_name>@<ip_addr>
```

```
isc@mobile: ~
mobilerobots@mobilerobots-vm:~$ ssh isci@192.168.1.119
isc@192.168.1.119's password:
Welcome to Ubuntu 16.04.3 LTS (GNU/Linux 4.4.38-v7+ armv7l)

```

Fig.8 `ssh` command for remote connection

B. ROS

1. ROS file system level structure

Reference: <http://wiki.ros.org/ROS/Concepts>

Fig.9 ROS file system level structure

(1-1) Packages:

Packages are the main unit for organizing software in ROS. A package may contain ROS runtime processes (nodes), a ROS-dependent library, datasets, configuration files, or anything else that is usefully organized together. Packages are the most atomic build item and release item in ROS. Meaning that the most granular thing you can build, and release is a package.

2. ROS computation graph level

Reference: <http://wiki.ros.org/ROS/Concepts>

Fig.10 ROS computation graph level

(2-1) Nodes:

Nodes are processes that perform computation. ROS is designed to be modular at a fine-grained scale; a robot control system usually comprises many nodes. For example, one node controls a laser range-finder, one node controls the wheel motors, one node performs localization, one node performs path planning, one Node provides a graphical view of the system, and so on. A ROS node is written with the use of a ROS client library, such as *roscpp* or *rospy*.

(2-2) Master:

The ROS Master provides name registration and lookup to the rest of the Computation Graph. Without the Master, nodes would not be able to find each other, exchange messages, or invoke services.

(2-3) Topics:

Messages are routed via a transport system with publish / subscribe semantics. A node sends out a message by publishing it to a given topic. The topic is a name that is used to identify the content of the message. A node that is interested in a certain kind of data will subscribe to the appropriate topic. There may be multiple concurrent publishers and subscribers for a single topic, and a single node may publish and/or subscribe to multiple topics. In general, publishers and subscribers are not aware of each other's existence. The idea is to decouple the production of information from its

consumption. Logically, one can think of a topic as a strongly typed message bus. Each bus has a name, and anyone can connect to the bus to send or receive messages as long as they are the right type.

(2-4) Messages:

Nodes communicate with each other by passing messages. A message is simply a data structure, comprising typed fields. Standard primitive types (integer, floating point, boolean, etc.) are supported, as are arrays of primitive types. Messages can include arbitrarily nested structures and arrays (much like C structs).

(2-5) Parameter Server:

The Parameter Server allows data to be stored by key in a central location. It is currently part of the Master.

3. Create package file

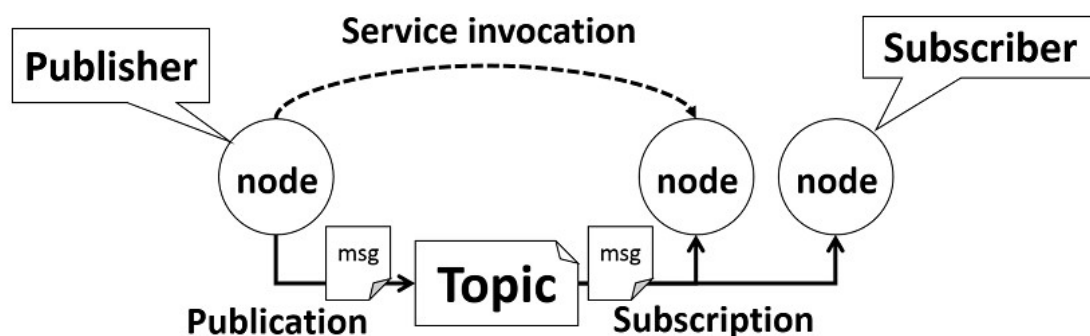

Create a ROS package by using `catkin_create_pkg` command.

```
$ cd catkin_ws/src
```

```
$ catkin_create_pkg [package_name] [dependency1] [dependency2]
```

Common dependency such as `roscpp`, `std_msgs`, `actionlib`, `actionlib_msgs`...etc.

4. ROS nodes communication

5. Publisher and Subscriber

Reference: *Mastering ROS for Robotics Programming*, p.29-31

(5-1) This example code will publish an integer value on a topic called `/numbers`.

```
Demo_topic_publisher.cpp
1 #include "ros/ros.h"
2 #include "std_msgs/Int32.h"
3 #include <iostream>
4 int main(int argc, char **argv)
5 {
```

```

6   ros::init(argc, argv, "demo_topic_publisher");
7   ros::NodeHandle node_obj;
8   ros::Publisher number_publisher =
   node_obj.advertise<std_msgs::Int32>("/numbers", 10);
9   ros::Rate loop_rate(10);
10  int number_count = 0;
11  while (ros::ok())
12  {
13      std_msgs::Int32 msg;
14      msg.data = number_count;
15      ROS_INFO("%d", msg.data);
16      number_publisher.publish(msg);
17      ros::spinOnce();
18      loop_rate.sleep();
19      ++number_count;
20  }
21  return 0;
22  }

```

Here is some detailed explanation of the example code:

```

6   ros::init(argc, argv, "demo_topic_publisher");

```

This code will initialize a ROS node with a name. It should be noted that the ROS node should be unique. This line is mandatory for all ROS C++ nodes.

```

7   ros::NodeHandle node_obj;

```

This will create a *Nodehandle* object, which is used to communicate with the ROS system.

```

8   ros::Publisher number_publisher =
   node_obj.advertise<std_msgs::Int32>("/numbers", 10);

```

This will create a topic publisher and name the topic */number* with a message type *std_msgs::Int32*.

The second argument is the buffer size. It indicates that how many messages need to be put in a buffer before sending.

```

9   ros::Rate loop_rate(10);

```

This is used to set the frequency of sending data.

```
11 ros::ok()
```

This function returns zero when there is an interrupt like *Ctrl+C*.

```
16 number_publisher.publish(msg);
```

This will publish the message to the topic */numbers*.

(5-2) This example code is the definition of the subscriber node:

```
Demo_topic_subscriber.cpp
1 #include "ros/ros.h"
2 #include "std_msgs/Int32.h"
3 #include <iostream>
4 void number_callback(const std_msgs::Int32::ConstPtr& msg)
5 {
6     ROS_INFO("Received [%d]", msg->data);
7 }
8 int main(int argc, char **argv)
9 {
10     ros::init(argc, argv, "demo_topic_subscriber");
11     ros::NodeHandle node_obj;
12     ros::Subscriber number_subscriber =
13         node_obj.subscribe("/numbers", 10, number_callback);
14     ros::spin();
15     return 0;
16 }
```

Here is some detailed explanation of the example code:

```
4 void number_callback(const std_msgs::Int32::ConstPtr& msg)
5 {
6     ROS_INFO("Received [%d]", msg->data);
7 }
```

This is a callback function that will execute whenever a data comes to the */numbers* topic. Whenever a data reaches this topic, the function will call and extract the value and print it on the console.

```
12 ros::Subscriber number_subscriber =
    node_obj.subscribe("/numbers", 10, number_callback);
```

This is the subscriber and here, we are giving the topic

name needed to subscribe, buffer size, and the callback function. We are subscribing `/number` topic and we have already seen the callback function in the preceding section.

6. CMakeLists.txt:

Reference: <http://wiki.ros.org/catkin/CMakeLists.txt>

(6-1) The file **CMakeLists.txt** is the input to the CMake build system for building software packages. Any CMake-compliant package contains one or more CMakeLists.txt file that describe how to build the code and where to install it to. The CMakeLists.txt file used for `catkin_make` project.

(6-2) Building the nodes for example. We have to edit the `CMakeLists.txt` file in the package to compile and build the source code. The following example code is responsible for building those two nodes above.

```
1 include_directories(
2     include
3     ${catkin_INCLUDE_DIRS}
4     ${Boost_INCLUDE_DIRS}
5 )
6
7 # This will create executables of the nodes
8 add_executable(demo_topic_publisher src/demo_topic_publisher.cpp)
9 add_executable(demo_topic_subscriber src/demo_topic_subscriber.cpp)
10
11 # This will generate message header file before building the target
12 add_dependencies(demo_topic_publisher
13     mastering_ros_demo_pkg_generate_message_cpp)
14 add_dependencies(demo_topic_subscriber
15     mastering_ros_demo_pkg_generate_message_cpp)
16
17 # This will link executables to the appropriate libraries
18 target_link_libraries(demo_topic_publisher ${catkin_LIBRARIES})
19 target_link_libraries(demo_topic_subscriber ${catkin_LIBRARIES})
```

Build mastering_ros_demo_package as follow:

```
$ cd ~/catkin_ws
$ catkin_make mastering_ros_demo_package
```

7. roslaunch:

Reference: *Mastering ROS for Robotics Programming, page 48*

(7-1) The *launch* files in ROS are a very useful feature for

launching more than one node. It is difficult if we run each node in a terminal one by one. Instead of that, we can write all nodes inside a *XML* based file called *launch* files and using a command called *roslaunch*, we can parse this file and launch the nodes.

(7-2) Create a *launch* folder to keep the launch files

```
$ cd ~/catkin_ws/src/<ros_package>
$ mkdir launch
```

(7-3) The example launch file will launch two ROS nodes that are publishing and subscribing an integer value.

Demo_topic.launch	
1	<launch>
2	<node name="publisher_node" pkg="mastering_ros_demo_pkg"
3	type="demo_topic_publisher" output="screen" />
4	<node name="subscriber_node" pkg="mastering_ros_demo_pkg"
	type="demo_topic_subscriber" output="screen" />
5	</launch>

(7-4) After creating the launch file, you can launch it by using the following command:

```
$ roslaunch mastering_ros_demo_pkg demo_topic.launch
```

C. *rosserial* package

1. Arduino IDE setup

(1-1) Download Arduino IDE on your PC and Raspberry Pi by typing instructions below in Terminal. The first two instructions will take some time.

```
$ sudo apt-get update
$ sudo apt-get upgrade
$ sudo apt-get install arduino
```

(1-2) Set Serial Port Permission

Reference: <https://www.arduino.cc/en/Guide/Linux>

Connect your Arduino UNO board in the device you are setting in, if you're setting Arduino IDE in Raspberry pi then connect Arduino UNO with Raspberry Pi, so does your PC.

Open Terminal and type:

```
$ ls -l /dev/ttyACM*
```

You will get something like:

```
crw-rw---- 1 root dialout 188, 0 5 apr 23.01 ttyACM0
```

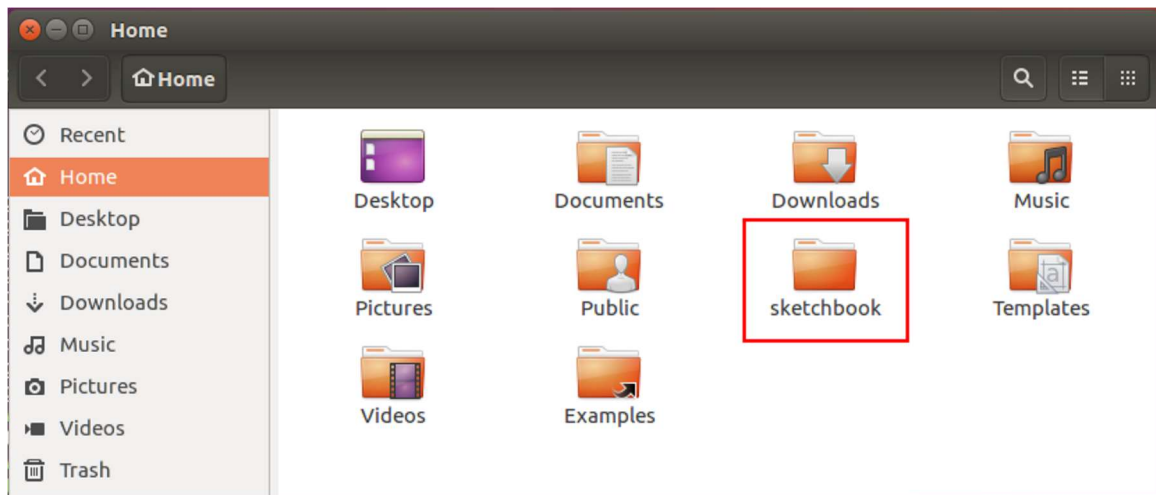

The “0” at the end of ACM might be a different number, or multiple entries might be returned. The data we need is “dialout” (is the group owner of the file).

Then add our user to the group by typing follow instruction in Terminal:

```
$ sudo usermod -a -G dialout <username>
```

Where <username> is your linux user name. You will need to log out and log in again for this change to take effect.

(1-3) You can test your Arduino IDE is work or not by typing `arduino` in Terminal. And after you can open Arduino sketch successfully, you can find a new folder called “sketchbook” in /home.

2. Create *swap* Space

Reference:

http://book.duckietown.org/master/duckiebook/duckiebot_ubuntu_image.html

Because Raspberry Pi only has 1G memory space which is not enough for programming, so we highly recommend use *swap* to help for more memory space.

(2-1) What is swap space?

Swap space in Linux is used when the amount of physical memory (RAM) is full. If the system needs more memory resource and the RAM is full, inactive pages in memory are moved to the swap space.

While swap space can help machines with a small amount of RAM, it should not be considered a replacement for more RAM. *Swap* space is located on hard drives, which have a

slower access time than physical memory.

(2-2) Create a 512 MB *swap* space by following instructions:

```
$ sudo dd if=/dev/zero of=/swap0 bs=1M count=512
$ sudo mkswap /swap0
```

(2-3) Add the swap file to the system configuration:

```
$ sudo vim /etc/fstab
```

Add this line to the bottom:

```
/swap0 swap swap
```

(2-4) Activate the swap space:

```
$ sudo swapon -a
```

3. Installing the Software

Reference: http://wiki.ros.org/rosterial_arduino/Tutorials

(3-1) Installing from Source onto the ROS workstation

```
$ cd <ws>/src
$ git clone https://github.com/ros-drivers/rosterial.git
$ cd <ws>
$ catkin_make
```

(3-2) Install *ros_lib* into the Arduino Environment

```
$ cd sketchbook/libraries
$ rm -rf ros_lib
$ rosrn rosterial_arduino make_libraries.py
```

After restarting your IDE, you should see *ros_lib* listed under File>examples or File>sketchbook.

4. Create a publisher by using *rosterial*

Reference:

http://wiki.ros.org/rosterial_arduino/Tutorials>Hello%20World

(4-1) This example code is in the

File>example>ros_lib>HelloWorld. This code will create a node publishes “Hello World” from Arduino.

	Hello World.ino
1	#include <ros.h>
2	#include <std_msgs/String.h>
3	
4	ros::NodeHandle nh;
5	
6	std_msgs::String str_msg;

```

7   ros::Publisher chatter("chatter", &str_msg);
8
9   char hello[13] = "hello world";
10
11  void setup()
12  {
13      nh.initNode();
14      nh.advertise(chatter);
15  }
16
17  void loop()
18  {
19      str_msg.data = hello;
20      chatter.publish( &str_msg);
21      nh.spinOnce();
22      delay(1000);
23  }

```

(4-2) To upload the code to your Arduino, use the upload function within the Arduino IDE. This is no different from uploading any other sketch.

(4-3) Running the code

Open a new Terminal and type:

```
$ roscore
```

Other new Terminal and type:

```
$ rosruntime python serial_node.py /dev/ttyACM0
```

Another new Terminal and type:

```
$ rostopic echo /chatter
```

```

lscli@mobile:~$ rostopic echo chatter
data: "hello world!"
---
data: "hello world!"
---
data: "hello world!"
---
data: "hello world!"
---
data: "hello world!"
---
data: "hello world!"
---
data: "hello world!"
---
data: "hello world!"
---
data: "hello world!"
---
data: "hello world!"

```

5. Create a subscriber by using *rosserial*

Reference: http://wiki.ros.org/rosserial_arduino/Tutorials/Blink

(5-1) This example code is in the File>example>ros_lib>Blink.

This code will create a subscriber and the LED on the Arduino will toggle every time receive a empty message from Raspberry Pi.

Blink.ino	
1	#include <ros.h>
2	#include <std_msgs/Empty.h>
3	
4	ros::NodeHandle nh;
5	
6	void messageCb(const std_msgs::Empty& toggle_msg){
7	digitalWrite(13, HIGH-digitalRead(13)); // blink the led
8	}
9	
10	ros::Subscriber<std_msgs::Empty> sub("toggle_led", &messageCb);
11	
12	void setup()
13	{
14	pinMode(13, OUTPUT);
15	nh.initNode();
16	nh.subscribe(sub);
17	}
18	
19	void loop()
20	{
21	nh.spinOnce();
22	delay(1);
23	}

(5-2) To upload the code to your Arduino, use the upload function within the Arduino IDE.

(5-3) Running the code

Open a new Terminal and type:

```
$ roscore
```

Other new Terminal and type:

```
$ rosrunc rosserial_python serial_node.py /dev/ttyACM0
```

Another new Terminal and type:

```
$ rostopic pub toggle_led std_msgs/Empty --once
```

- Hardware architecture
